Annotation: It is very important to teach the subject of education in the primary grades. It is a subject that teaches young people to think in textbooks, to educate them to be loyal to our national values and to be patriotic. This article discusses about the need to teach the subject of education in primary school.

Keywords: primary school, education, subject of education, patriotism, national value, tradition, culture, admiration

The curriculum and textbooks of the subject "Education" emphasize the formation of skills such as patriotism, entrepreneurship, will, ideological immunity, kindness, responsibility, tolerance, legal culture, innovative thinking, diligence. In particular, it is widely used as an example of national traditions, the lives and ways of great scholars, the works of contemporary heroes. The science of education is very rich and diverse in content. Teaching the subject of education and students influences their consciousness, upbringing and thinking through learning activities, their perfection helps to find. Therefore, the content of the training is to teach the subject of education in the education system. Improving the quality and effectiveness, as well as activating the learning activities of students serves as a factor. Therefore, the teacher has a positive effect on the activation of cognitive activity in the selection of methodological methods and tools that provide effective teaching and learning in general. The content of the educational material studied should also be taken into account. Strictness between the components of the process of teaching methods of education reveals the laws that are manifested in repetitive interactions and connections, and and guidelines for their use in improving the teaching process will give. Thus, the methodology of teaching the subject of education in the system of education of teachers equips with the scientific and theoretical foundations of teaching. The methodology is also the subject of educating them. It also equips the teaching process with verification methods of study. The process of teaching the subject of education is studied in two ways. Activation of students' cognitive activity in the effectiveness of teaching science plays an important role. Active learning activities of students in class and extracurricular activities. The existence of many factors depends, first of all, on the ideological and scientific-theoretical content of the training to be at a high level, to be able to reveal the most important thing in a vivid and convincing way, and that students' understanding of the importance of in-depth study of events, and in them it depends on arousing the desire to learn. This is where the teacher trains the students control over the mastery of the content, the ability to control the learning of students, as well as from their existing knowledge and skills to assimilate their new knowledge. It is also important to be able to use it, that is, to update the acquired knowledge and skills is important. And again, these would mean that you have to spend for these processes. We believe that the main responsibility for parenting lies with the parents. There are many ways to fight for the human heart and mind today. Developed by "experts" and implemented in a narrow range of practice, the purpose of those who spread their malicious goals is clear. In other words, ideological training grounds are more dangerous than war training grounds. But can we instill in our youth an ideological immunity against foreign ideas ?! Can we stand up to alien and destructive ideas when the time comes ?! So I think educators, leaders, and those who are and those who are not, should be vigilant. As you can see, I'm sharing my thoughts in the information, but now I'm moving on. I recently came across the following information. Remember that the science of education is a big responsibility and a heavy burden. If this subject is taught in the school, it will be a great relief for the school administration, teachers and parents. No matter which science teacher teaches the subject, it would be good to feel the weight of the subject. In conclusion, I would like to emphasize that students who grow up knowing and feeling the good and the bad, the honest and the dirty, the crooked and the right, the respect and the love and the consequences, will definitely contribute to the development of society. We believe that Although he has unparalleled knowledge, skills and memory,

but any employee, leader, and anyone in society in general who is devoid of human emotions, believe me, he will not hesitate to give you a reason at the most appropriate time and place. It doesn't matter. Education is crucial in many areas, and without education, a country will always be in decline and in crisis. Life itself has always proved the validity of the proposals and comments on the upbringing of the child on the basis of nationality, values, folk pedagogy, upbringing on the basis of true human feelings and attention to physical education. And let's not forget that time is not lost in upbringing, and the pain of lost time is probably more painful than the pain of generations.
